

Artificial Neural Networks

AHP Slot- 1

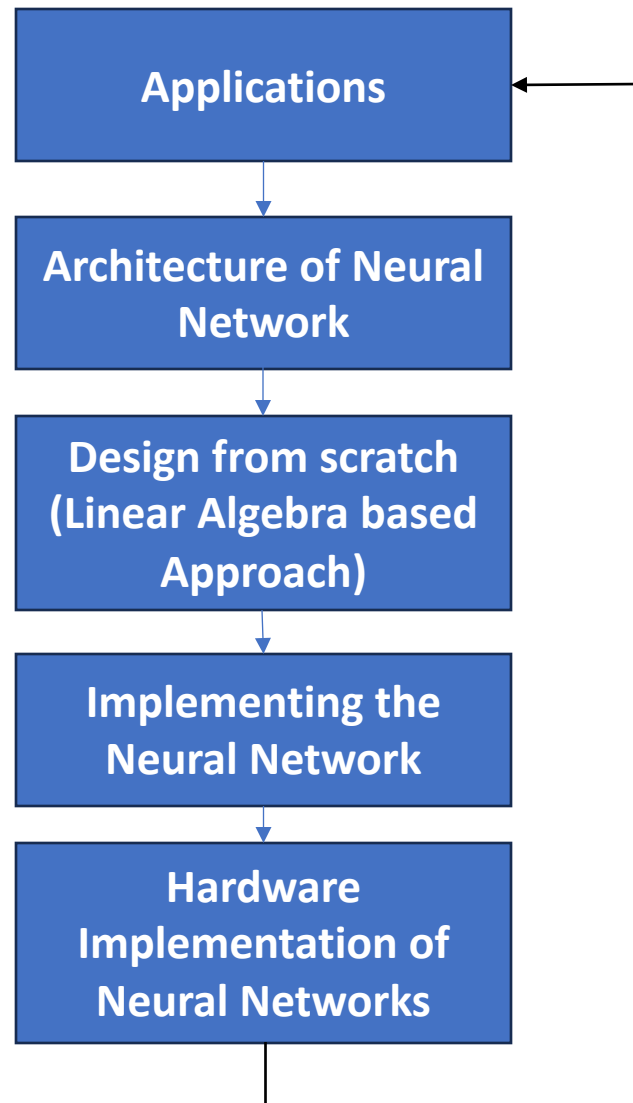

Neural Networks: Why in Computing and VLSI Industry?

Dheemanth Joshi , Aniket Gangotri, CH Sai Pranay, Shwetha R*

Teaching Assistant, Department of Electronics and Communication Engineering, PES University

*** Faculty In-charge, Department of Electronics and Communication Engineering PES University**

ANN AHP Slots: A Top-Down Approach

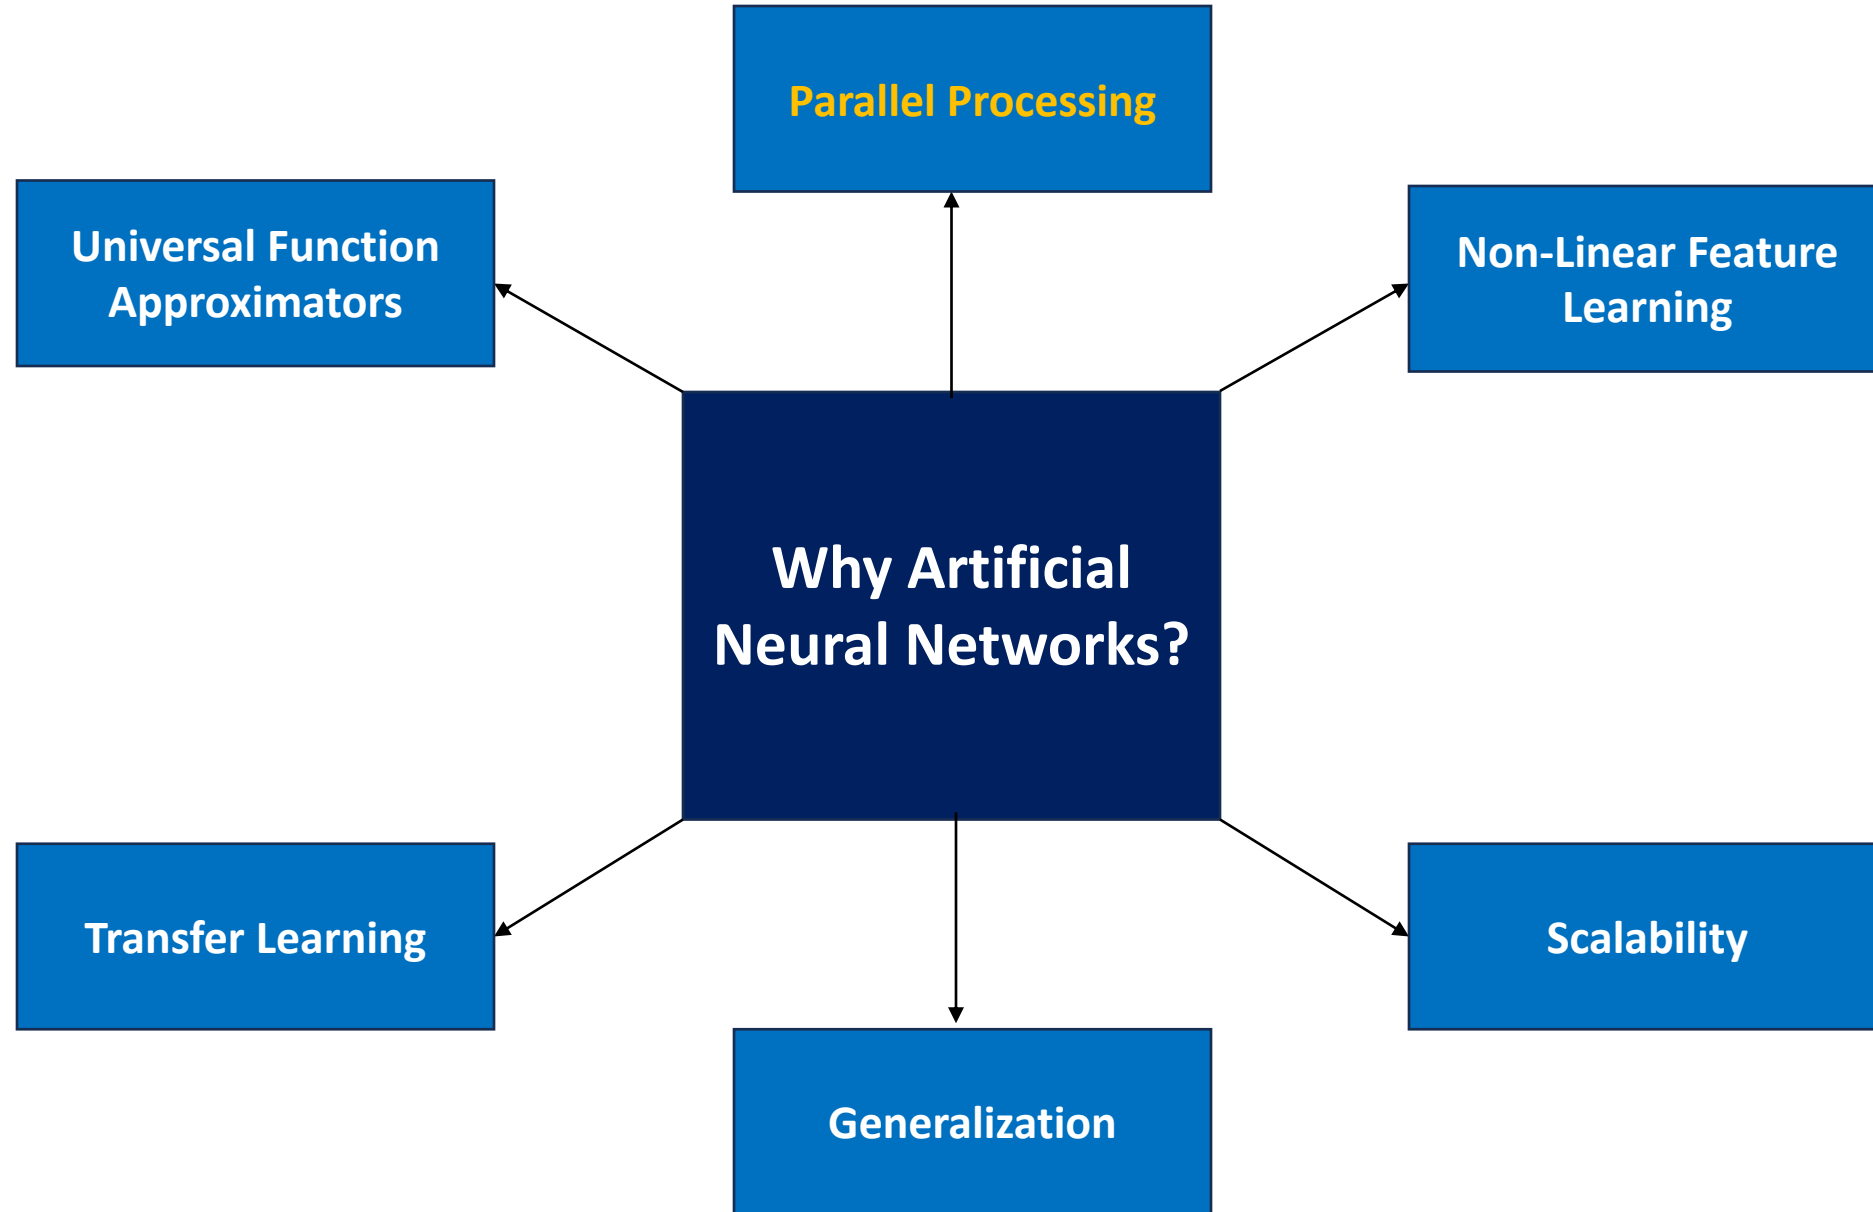

Input

Basic Working of Neural Network

Why Top-Down Approach for understanding Neural Networks ?

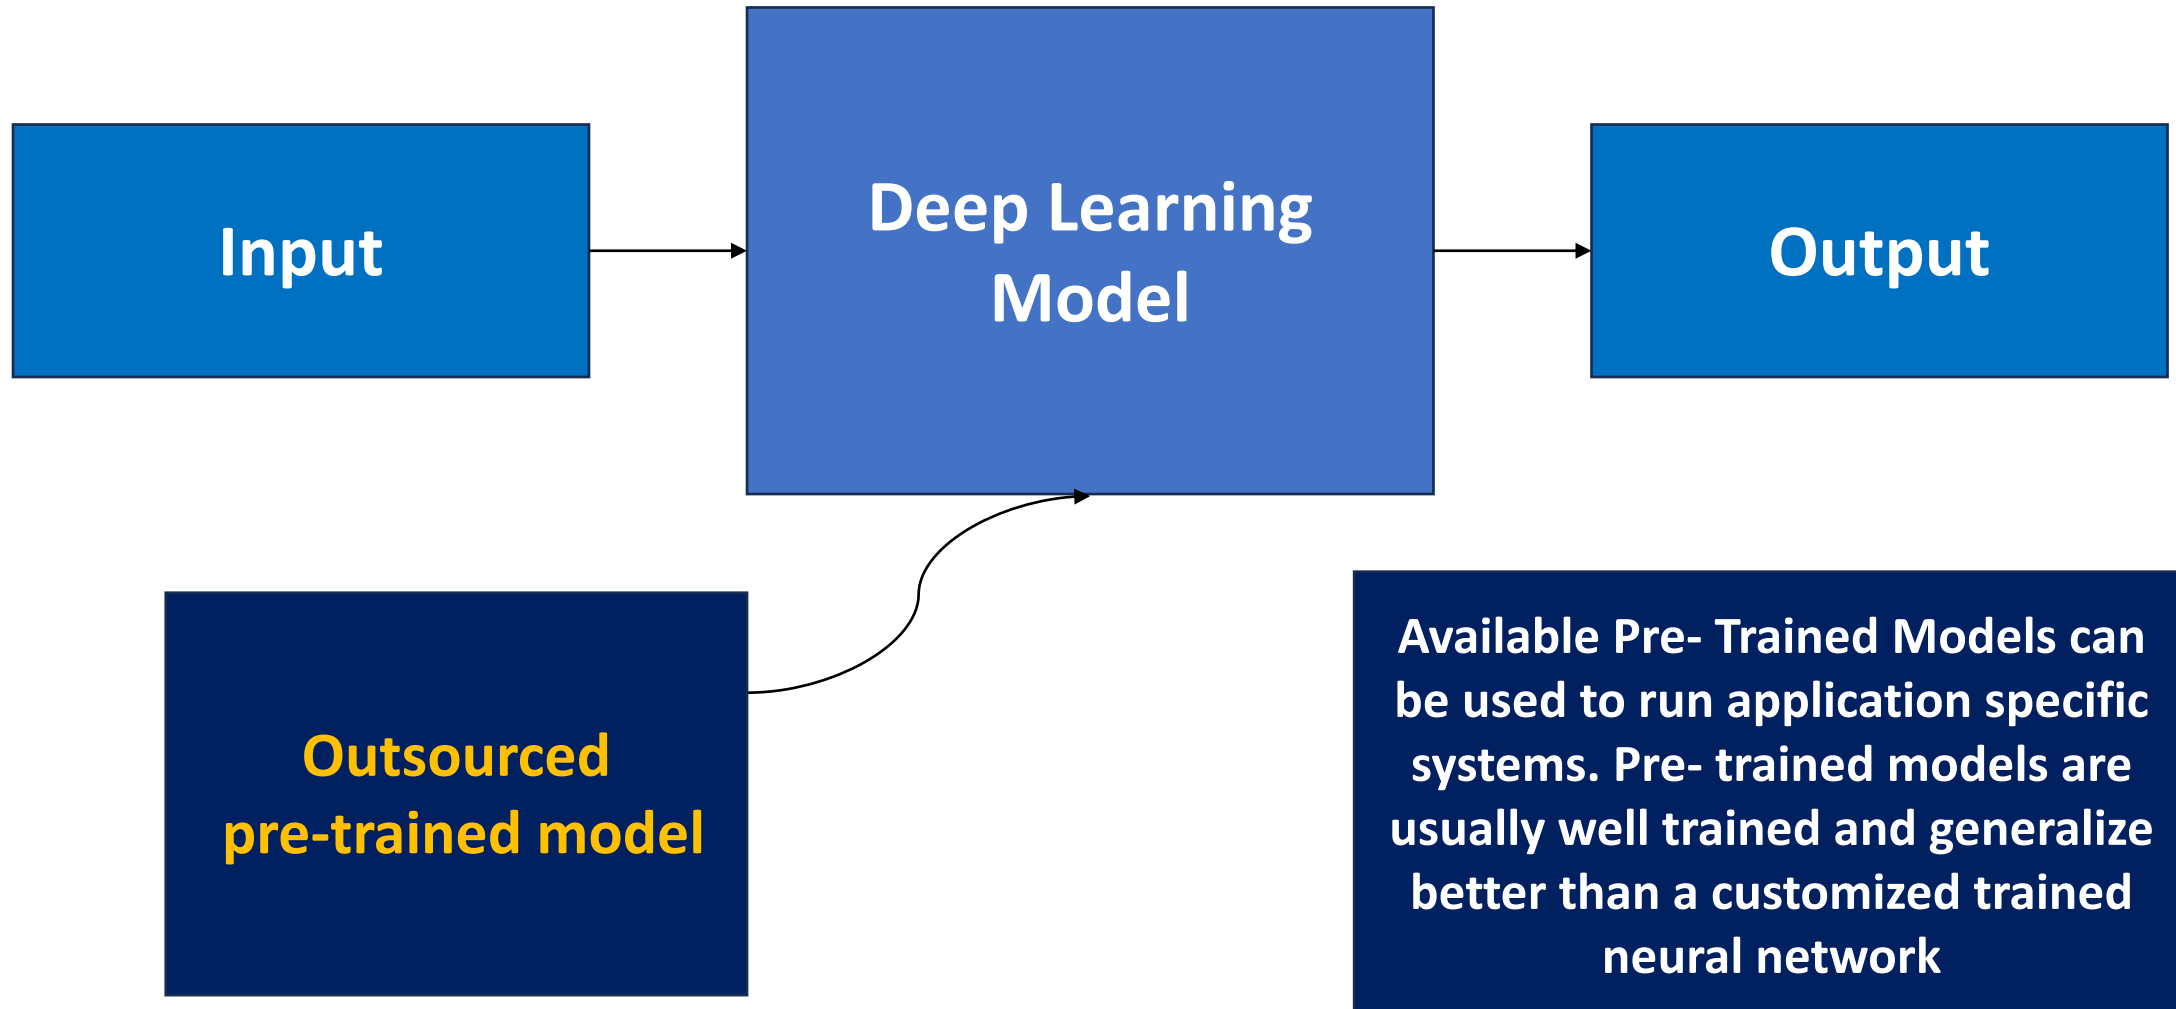

Universal Function Approximators

**Well Trained Neural
Networks can learn any
multidimensional feature
problem and predict the
most accurate solution to the
problem**

Transfer Learning

Non-Linear Feature Learning

- **Features are extracted from dataset to learn and map data.**
- **Complex Neural Network architectures can learn multi dimensional, non-linear datasets.**
- **Helpful in probabilistic and dynamic environment operated systems.**

Generalization

- Neural Networks generalize better on new datapoints.

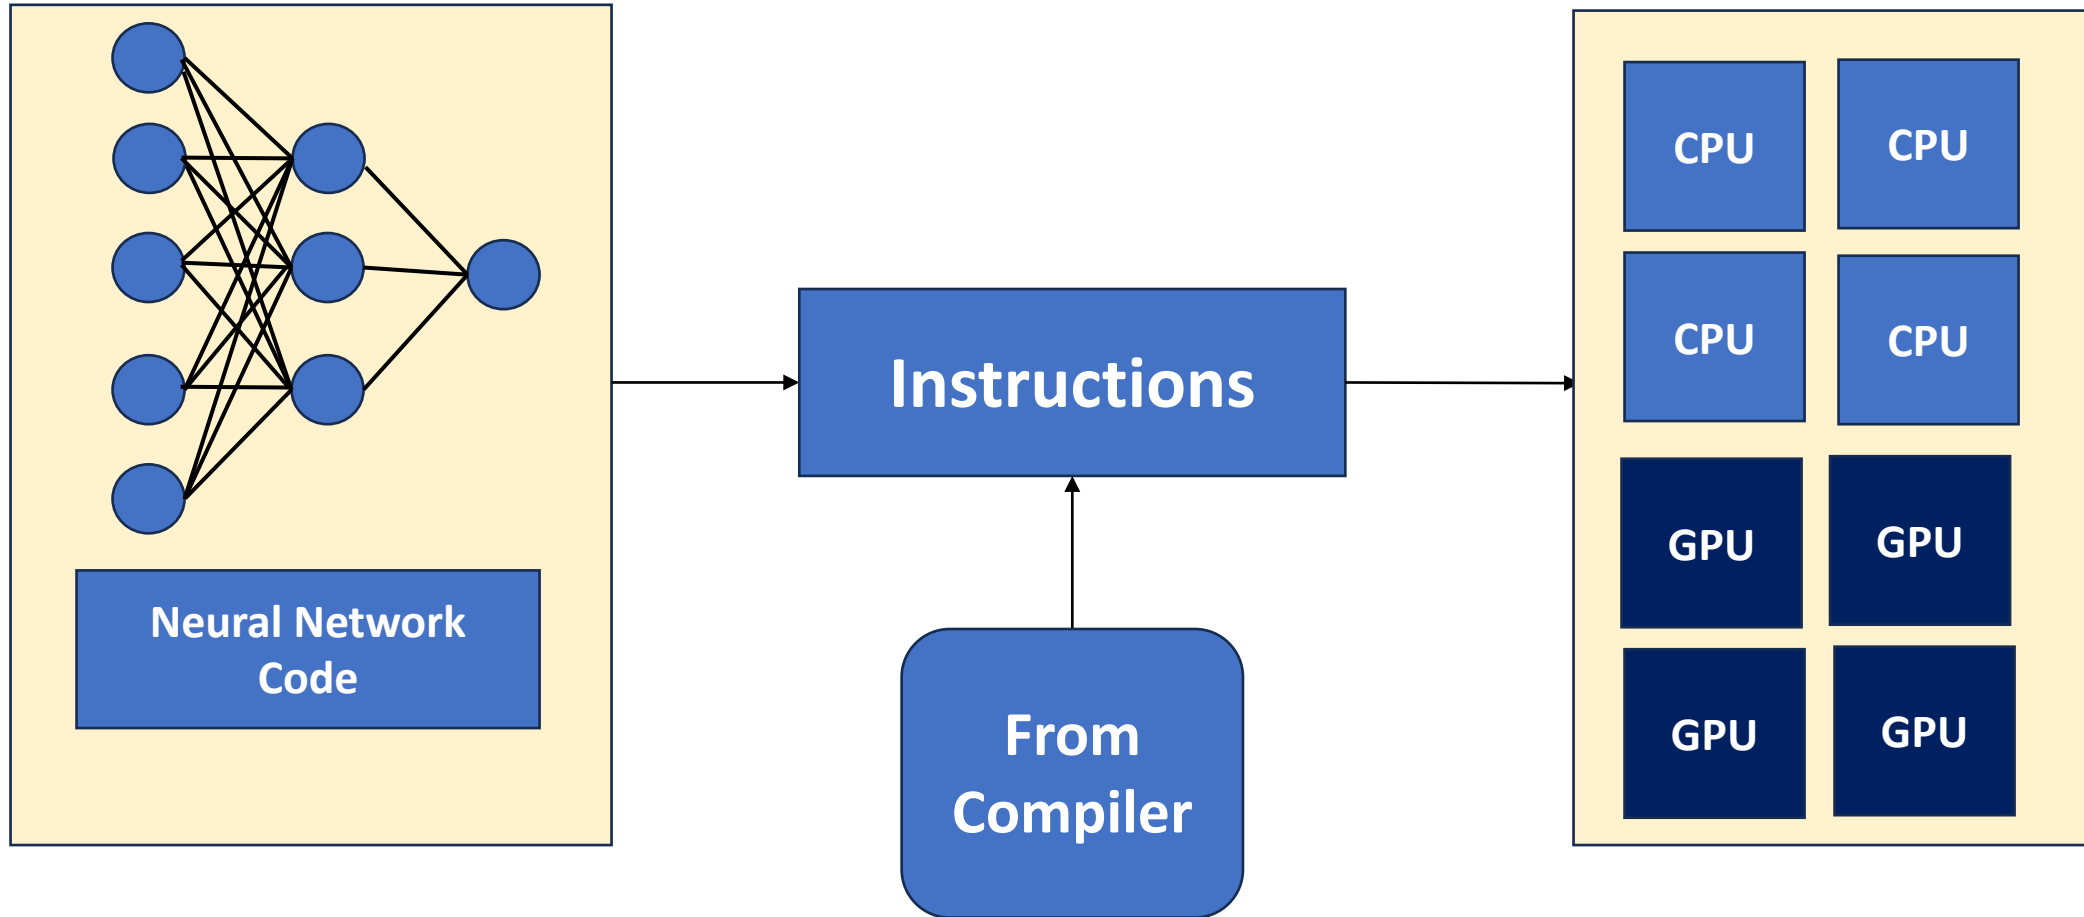

Features of all the cats in this image are different, but all belong to same class
“CAT”

Parallel Processing- 1

- **Most of the instructions in neural network designs are independent hence parallelism and pipelining can be employed.**
- **If the number of computing units is high, we can employ parallelism easily for neural network algorithms unlike other machine learning (ML) models.**
- **Modern ASICs are being developed to accelerate neural processing.**

Parallel Processing- 2

General structure of parallel computing

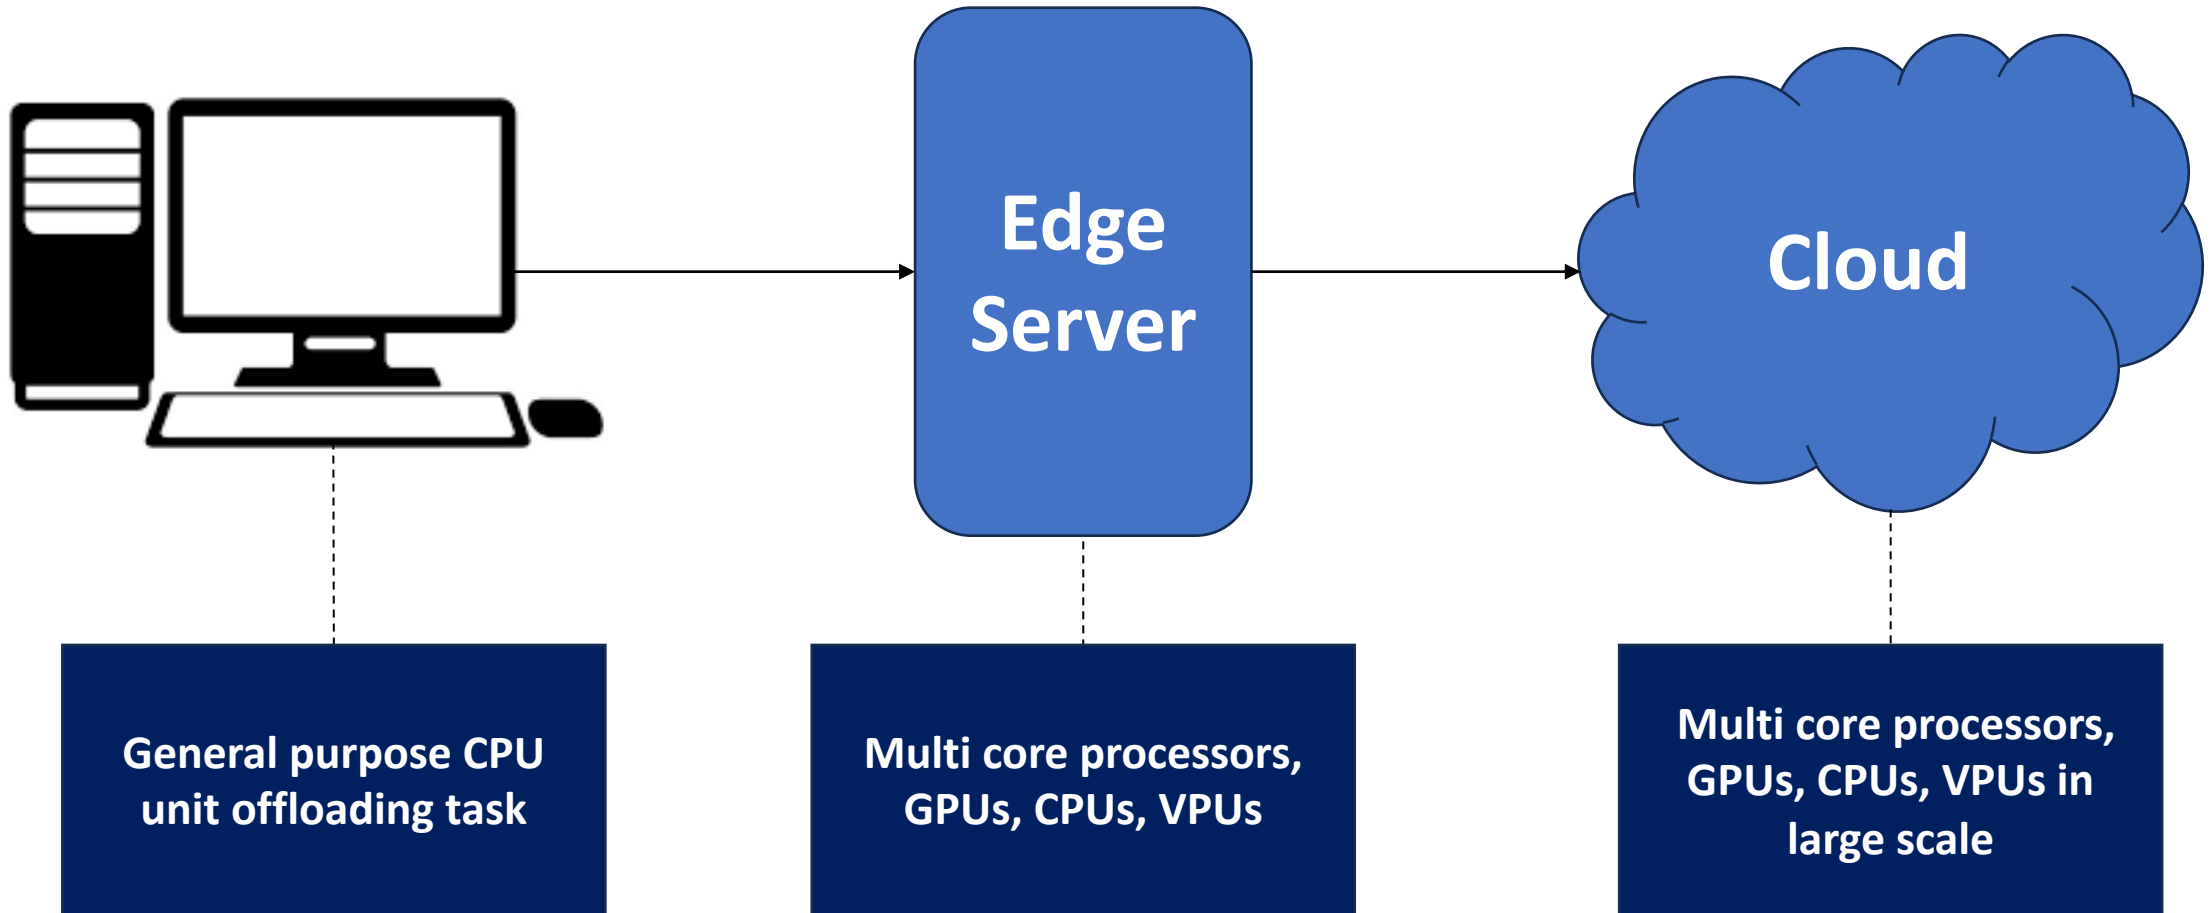

Applications/Research Areas of Neural Networks

- **Cloud and Edge Computing**
- **Computer Vision for ADAS systems**
- Healthcare
- Language Models
- Generative AI

Cloud and Edge Computing

Computer Vision for ADAS systems

Neural Networks are used for:

- **Object Detection**
- **Object Recognition**
- **Image Segmentation**
- **Driving Automation**

Neural Networks In Industries- AI Accelerators

Modern AI Hardware include:

- 1) Neuromorphic Processors**
- 2) Vision Processors**
- 3) Neural Network Accelerators**
- 4) Neural Engines**

Highly customized AI chips are often deployed in complex real time systems to handle tasks which are latency and power sensitive

Neural Networks In Industries- Intel

Intel AI Development and Tools:

- 1) DevCloud: A cloud service provider with heterogenous cores (CPUs, GPUs, FPGAs, VPU) for AI developers.**
- 2) Neural Network acceleration boards for fast and efficient computations**
- 3) Cloud to Edge Regime: Installations of various edge servers capable running large AI algorithms**
- 4) OpenVINO toolkit for software development**

Neural Networks In Industries- Intel's Vision Processing Unit

**VPUs are generally used for
Edge AI oriented image
processing / Computer vision
applications
It consists of dedicated vision
accelerators and vector
processors integrated with the
CPU.**

Neural Networks In Industries- Apple

Apple's M series System on Chip (SoC)

M1 chip can have upto:

- 1) 8 cores of CPU**
- 2) 8 cores of GPU**
- 3) Neural Engine for accelerate AI applications**

Task: Can you access each core individually in M1 chip?

Neural Networks In Industries- Nvidia

Nvidia's AI applications:

- 1) High quality graphics
- 2) Software to build graphics/
other AI applications
- 3) Graphic cards to run intense
vector operations

QNA
Thanks
